The MCD project aims to conduct a baseline survey on the state of minorities in the districts identified by the Ministry of Minority Affairs, Government of India. The minorities are defined on the basis of National Commission of Minorities Act, 1992 and includes Muslims, Sikhs, Christians, Buddhists and Zoroastrians (Parsis). Birbhum is classified as 'A' category district of this project for which both the sets of religion specific socio-economic and basic amenities indicators are below the respective national averages with the values being 38.7 and 16.9. Muslims with a share of 35.08% (as per Census 2001) in total population constitute the minority population of the district.

The purpose of this sample survey is to help the district administration draw action plan for socio-economic and infrastructure development of the district for improving the quality of life of the people and reducing the imbalances during the 11 th. Five Year Plan. However, it may be noted that the benefits will accrue to all sections of people in the district where intervention is executed and not only the minorities.

The survey was conducted in 30 villages in Birbhum district spread across 16 Blocks during April, 2008. Findings of the survey are categorized under the broad headings of **Basic Amenities; Education; Health; Infrastructure; Occupational conditions; Existence and Efficacy of Government Schemes and any other issue**. We have provided two sets of tables, one for the data across villages to capture the locational variation followed by the district averages computed over all the households surveyed in all the sample villages chosen in the district. For some of the indicators, e.g. total literacy the district performed quite well compared to the national average or for that matter even for the district average as per Census 2001. However, one should interpret these results with caution bearing in mind the fact that the results are based on a sample survey and

that it may not tell all the truth. In this particular case of literacy literate does not mean that the people are educated. When one looks into drop out rate the survey results shows a very grim picture. It is worth noting that it is not necessarily the case that the Muslims fall behind the non-Muslim population in general.

We have discussed the conditions of the district in terms of the major indicators; we have provided the current status of the most important eight indicators identified by the Ministry of Minority Affairs, viz. the four religion specific indicators and the four basic amenities indicators. In addition we have also provided the status of the many other indicators that we thought to be of relevance. Some of these are more disaggregated estimates for a particular indicator. For example we have gone into a detailed account of status of education, at different levels as we thought that only literacy is inadequate. We also provided the status of training in vocational trades and the demand for such training. This is important, in our opinion, as we tried to relate the same with job market situation for the general populace.

The findings for the district as a whole can be summarized in Table E1 below. We provide the deficit of the district for the religion specific socio-economic indicators and the basic amenities indicators where the deficit has been calculated as the deviation of the survey estimate from the national average based on NSSO, 2005 estimates and NFHS - 3 in the table below. In addition to these indicators we have also discussed about some of the indicators, which in our opinion are extremely important for the development of the district.

The above analysis is very broad in nature and requires intervention at a very larger scale and change in the attitude of the process of policy planning. Since the

approach of the Multi-sector Development Plan funded by the Ministry of Minority Affairs is supplementary in nature and does not intend to change the very nature of the plan process, it is suggested that the district administration may start working on priority basis with the additional fund in the areas where the deficit can very easily be identified at the district level or at the village or in the pockets of the district. Hence we provide the deficit of the district for the religion specific socio-economic indicators and the basic amenities indicators where the deficit has been calculated as the deviation of the survey estimate from the national average based on the estimates provided by the NSSO 2005 and NHFS-3 in Table E1 below. In addition to these indicators we have also discussed about some of the indicators, which in our opinion are extremely important for the development of the district.

Table E1: Priority Ranking of Facilities Based on Deficits of District Averages and National Averages

Sl. No.	Indicator	District Average	National Average	Deficit	Priority Rank
I. Socio-economic Indicators					
1	Literacy (%)	72.07	67.3	-4.77	4
2	Female Literacy (%)	65.00	57.1	-7.9	6
3	Work Participation (%)	62.63	38.0	-24.63	10
4	Female Work Participation (%)	31.23	21.5	-9.73	8
II. Basic Amenities Indicators					
5	Houses with Pucca Walls (%)	19.72	59.4	39.68	1
6	Safe Drinking Water (%)	95.77	87.9	-7.87	5
7	Electricity in Houses (%)	28.82	67.9	39.08	2
8	W/C Toilet (%)	13.77	39.2	25.43	3
III. Health Indicators					
9	Full Vaccination of Children (%)	66.52	43.5	-23.02	9
10	Institutional Delivery (%)	46.71	38.7	-8.01	7

Note: District averages are estimated on the basis of sample data on rural areas only, and national averages for Sl. No. (5) to (8) are based on NFHS-3, and the rest are based on NSSO, 2005.

It is clear from the above table that the district averages perform worst for houses

with pucca walls followed by electrified houses and W/C toilets. In all other cases district averages are higher than the corresponding national averages. Accordingly the district administration is expected to draw up their development plan funded by the Ministry of Minority Affairs based on the priority ranking of the facilities as listed above. Accordingly pucca houses with a rank of one and coverage of BPL families under IAY only 3.89%, it is natural that funding for IAY should receive highest priority. However, it may also be noted that the district averages and the deficits are not uniform across the district, there are large variations across the villages. A comparison may be made consulting the relevant tables for the village level averages. In this way one can find out the priority ranking for the villages separately. Given the representative nature of the sample one can treat those villages or the blocks where they are situated as the pockets of relative backwardness in terms of the above indicators. We draw the attention of the district administration to be cautious when drawing plan for the district.

In addition to the above priority ranking of facilities we also like to point out that there are some findings that the study team of the CSSSC thinks very important from the standpoint of the development of the district. This is specially so where the district averages are higher than the corresponding national averages. In such cases it makes better sense to concentrate the efforts of the district administration areas other than the above ten indicators as suggested by the Ministry. These are given below.

- The district average of the number of primary teachers per school (3.37 per school) is in fact higher than the national average (2.84 per school based on Census 2001), but the national average itself is very poor. It means that on an average all the four classes in a primary school cannot be held. So though the

district average is better than the national average, the district administration should pay attention to this.

- So far secondary schools are concerned, the performance of the district is very poor – 0.17 secondary and higher secondary schools per village. This also needs intervention.
- Apparently the district performs very poor in terms of health related infrastructure. So looking at only vaccination or institutional delivery is inadequate. A mere 0.04% of villages have government hospitals in its vicinity, 0.20 % of villages have primary health centers or sub-centres situated within the village, average distance of primary health center or sub-centres is 4.46 Km., average distance of government hospital is 21.23 Km., average distance of private hospital or nursing home is 19.29 Km. By no means these can be considered good whether they exceed national average or not, though in many cases they are lower than the national averages.
